Equipment**

Pack West's Machinery Audit Program

Pack West's Machinery Audit Program was developed to support our customers by maximizing their overall production performance. The program will keep your Pack West cappers and cap handling equipment running smoothly and fully optimized.

Pack West's Machinery Audit Program is an effective preventative maintenance option developed to increase your machines efficiency, application performance and overall asset utilization.

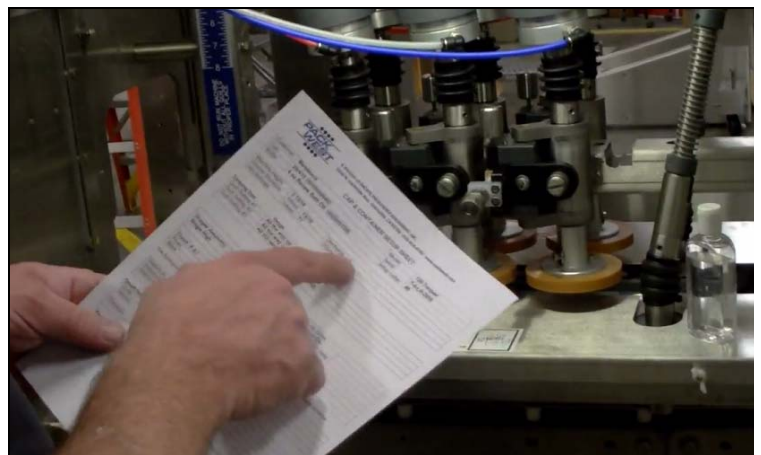

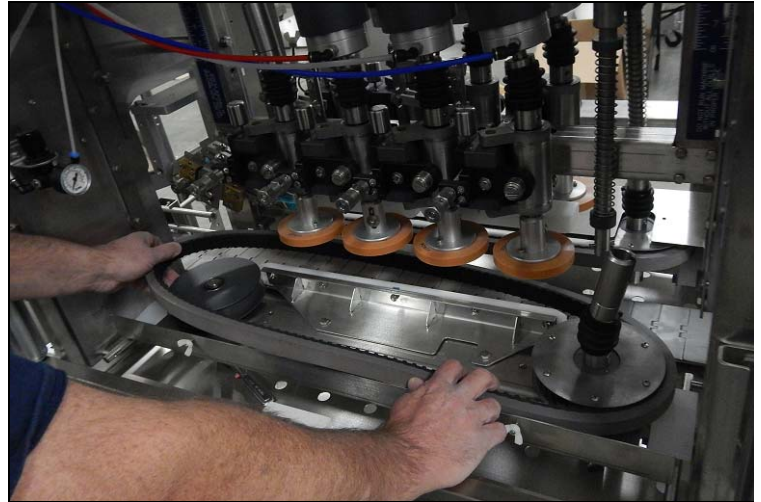

The Machinery Audit Program is performed on-site in one to two days depending on the number of cappers. Pack West technicians conduct a complete inspection of:

- the base machine
- capping zone
- closure delivery systems
- quill disks
- bottle controls
- electrical components

Following the inspection and analysis, a detailed written summary is provided to document the current condition of your system, complete with recommended action steps to improve your machine's overall performance.

Capping machines require periodic maintenance and rebuilding to deliver maximum application performance. In addition to the Machine Audit Program, Pack West offers an onsite rebuild of your capping machines. We schedule this service in conjunction with your customer preventive maintenance schedule, keeping downtime to a minimum.
